Summary

Safe operation and maintenance of submarine cables may conflict with marine renewable energy development. Although submarine cable locations are publicly available, safe setback distances are not readily available for planning new marine renewable energy development.

We applied industry advised depth-varying buffers to existing submarine cables: minimum (2*depth, i.e. “2z”) and recommended (3*depth, i.e. “3z”) with a mimimum of 500m. Of the original 230,835 km in the “NOAA Charted Submarine cables in the United States as of December 2012” dataset, 97,321 km fell within the 200 nm of the US exclusive economic zone (EEZ), which was analyzed across 12 territories that overlapped with the cables. A custom Equal Area Albers projection based on 1/6th the territorial extent was applied to minimize spatial distortion when applying buffer distances at 100 m depth increments using the GEBCO 30 arc-second global grid. The cable buffer area ranged from 29.35% (242,042 km² [3z] of 824,679 km² total) in the West owing to many cables present and the steep continental shelf having high depths, to virtually nill 0.01% (42 km² [2z] of 406,970 km² total) in Wake Island.

Overlap of cable buffers with marine renewable energy was assessed for tidal, wave and wind energy from NREL datasets...

Background

Demand for abundant and diverse resources in the oceans is growing, necessitating marine spatial planning. To inform development of Marine Hydrokinetic (MHK) and Offshore Wind (OSW) resources, DOE has asked NREL to identify — and mitigate where possible — the competing uses between MHK/OSW technologies and subsea power/telecoms cables. The first step in this work is to identify and quantify the overlap between the MHK/OSW resource availability and existing cable routes. Several publicly available data layers are available that identify cable routes (e.g. MarineCadastral.gov currently hosts an offshore cables geographical information system (GIS) data layer) and MHK/OSW resource density (MHK Atlas, Wind Prospector). The cable route linear features, however, do not indicate the setback distance necessary to accommodate subsea cable maintenance requirements. Preliminary work was done within NREL to evaluate the influence of subsea cable setback distance on the overlap with MHK/OSW for the west coast of the U.S (Amante, Kilcher, Roberts, & Draxl, 2016). Industry reports (Communications Security, Reliability and Interoperability Council IV, 2014, 2016) from the International Cable Protection Committee (ICPC) of the North American Submarine Cable Association (NASCA; n-a-s-c-a.org) advise on setback distances that inform this analysis.

Methods

Study Area and Submarine Cables

The study area included the 200 nm extent of US waters downloaded from MarineRegions.org¹ and overlapping the offshore cable data layer available through MarineCadastre.gov.² See Figure ??.

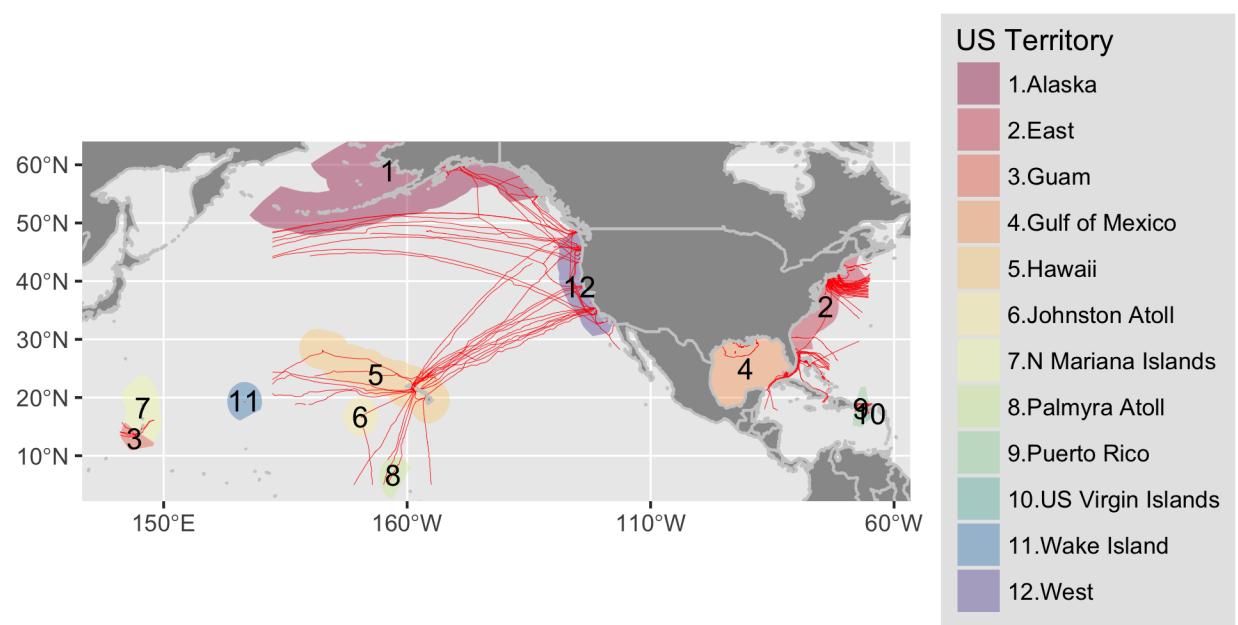

Figure 1: Map of NOAA Charted Submarine cables as of December 2012 within the exclusive economic zone (EEZ; 200 nm) of United States territories.

Avoidance Zones for Siting New Facilities

“ICPC Recommendation 13 No. 2, which establishes a methodology for determining site-specific proximity limits between submarine cables and offshore wind facilities and a default separation distance in shallower waters of 500 meters on either side of an in-service submarine cable — a separation standard the principles of which also apply to other offshore renewable energy projects.”

“Subsea Cables UK Guideline No. 6 (endorsed by NASCA), which establishes principles for determining safe proximity distances and negotiating proximity agreements between offshore wind farms and submarine cables and reflects extensive experience in the United Kingdom with managing spatial conflicts between offshore wind farms and submarine cables.”

“endorse a default separation distance of 500 meters in water depths of less than 75 meters and the greater of 500 meters or two times the depth of water in greater water depths.”

1. Default separation distance by depth:

- <= 250 m: 500 m
- > 250 m: 2 x depth

Pseudocode:

```
# buffer based on depth
cables_buffers = list()
for (x in unique(cable_cells$depth)){

  cables_buffers[str(x)] = cable_cells %>%
    subset(depth == x) %>%
    buffer(x)

}
cable_buf = merge(cables_buffers)

# smooth out jagged edges between cells
cable_buf = simplify(cable_buf)
```

Separation Zones for Routing New Cables

“ICPC Recommendation 2 No. 10: parallel submarine cables maintain a separation distance of the lesser of 3 times depth of water or (where not achievable) 2 times the depth of water following consultation and agreement between affected parties — a separation standard the principles of which also apply to spacing of submarine cables and other marine infrastructure”

At least 2 separation zones based on depth:

1. **Minimum:** 2 times the depth of water
2. **Recommended:** 3 times depth of water

Pseudocode:

```
# convert depth (GEBCO 30 sec resolution) to polygons of cells
depth_cells = as.polygon(depth_raster)

# intersect cables with depth cells
cable_cells = intersect(cables_lines, depth_cells)

# buffer based on depth
cables_buffers = list()
```

```

for (x in unique(cable_cells$depth)){
  cables_buffers[str(x)] = cable_cells %>%
    subset(depth == x) %>%
    buffer(x)

}
cable_buf = merge(cables_buffers)

# smooth out jagged edges between cells
cable_buf = simplify(cable_buf)

```

Depth-Varying Cable Buffer

A depth-varying buffer to the offshore cables, $2 * \text{depth}$ for “minimum” and $3 * \text{depth}$ for “recommended” separation zones for routing new cables, by first intersecting depth with cables, then iterating over each depth to apply the appropriate buffers before finally dissolving all buffers. In order to apply the buffer, I needed to project from geographic coordinates to a projection that minimizes area distortion, so chose Albers Equal Area and applied the “one-sixth rule” based on the extent of the cable features to minimize distortion.

Results

Cable Buffer

See Table .

Table 2: Overlap of Cable Buffers with US Territories.

Territory	Area (km ²)		Min. Cable (2z)		Rec. Cable (3z)
